

# Middleware definitions and overview

*Revision : 545*

Chantal Taconet

September 2021

# Overview

1. Which middleware?
2. Middleware for separation of concerns
3. Which middleware family
4. Architecture
5. Synthesis

# Middleware definitions

- Several definitions <sup>1</sup>
  - *Middleware is software glue.*
  - *Middleware is the slash in Client/Server*
  - *Software that mediates between an application program and a network.*
  - *Middleware is computer software that connects software components or applications. It is used most often to support complex, distributed applications. It goes on to say that it describes a piece of software that connects two or more software applications so that they can exchange data.*
  - *Middleware is any software that allows other software to interact.*
  - *Middleware is sometimes called plumbing because it connects application and passes data between them.*
  - *Middleware is software used for coupling high level system components (application) with basic system components (data and network)*

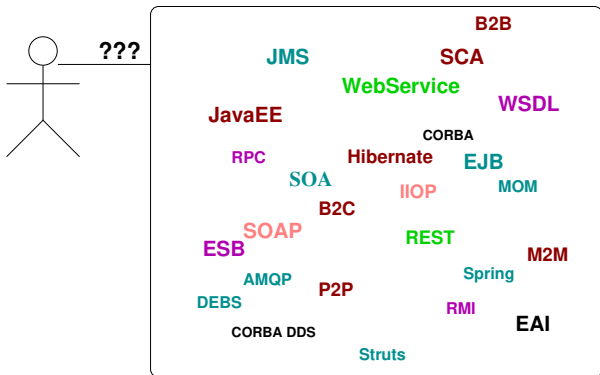

---

1. Found on <http://www.middleware.org/whatis.html> and <http://en.wikipedia.org/wiki/Middleware>

# Middleware as a universal adapter to build high level applications ?

# Which middleware?

- A wide number of middleware technologies are hidden under those acronyms!

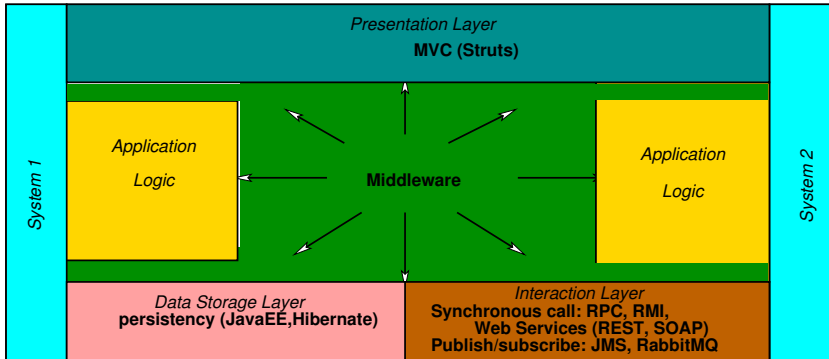

To master the complexity: Understand the abstractions, classify the middleware

## 2 Middleware for separation of concerns

1. Which middleware?
2. Middleware for separation of concerns
  - 2.1 Middleware: several concerns
  - 2.2 Separation of concerns and middleware
  - 2.3 Levels of heterogeneity addressed by middleware
  - 2.4 Middleware for several levels of distribution
  - 2.5 Examples of software distribution
3. Which middleware family
4. Architecture
5. Synthesis

## 2.1 Middleware: several concerns

## 2.2 Separation of concerns and middleware

- Middleware is a solution for the **separation of concern** paradigm

*In computer science, separation of concerns (SoC) is a design principle for separating a computer program into distinct sections, such that each section addresses a separate concern.*

- Separation of concern enables application designers to focus on their business
  - Use standard middleware components for handling non business preoccupations
- Through middleware, separation of concern is reached for :
  - Heterogeneity
  - **Distribution** of pieces of software
  - Persistency of components
  - New middleware for new preoccupations (e.g., middleware for the IoT)

## 2.3 Levels of heterogeneity addressed by middleware

- Middleware may address several level of heterogeneity
  - Hardware heterogeneity (e.g., *Little Endian* and *Big Endian* representation)
  - Operating System heterogeneity (e.g., library availability)
  - Language heterogeneity (e.g., one piece of software in *C*, another piece of software in *java*)
  - Application logic heterogeneity (e.g., data transformation from one application to the other)

## 2.4 Middleware for several levels of distribution

- Pieces of software connected by middleware may be distributed on:
  - Several processes (in the same computer)
  - Several computers (in the same local area network)
  - Several networks (in the same company)
  - Several companies

## 2.5 Examples of software distribution

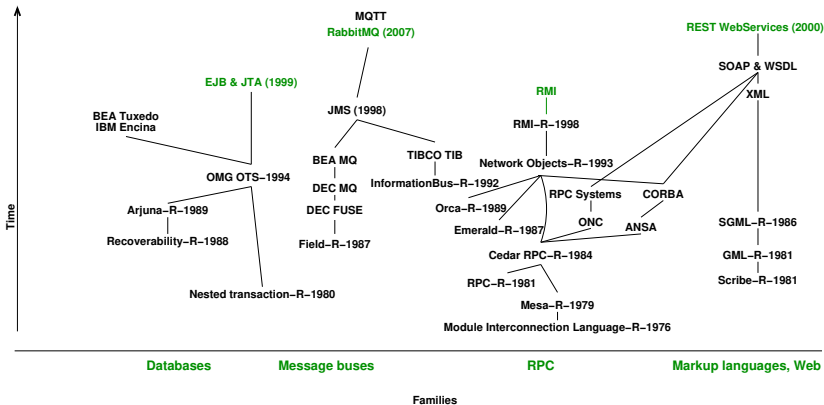

## 3 Which middleware family

1. Which middleware?
2. Middleware for separation of concerns
3. Which middleware family
  - 3.1 Families of middleware
  - 3.2 Main family history
  - 3.3 Interaction styles: synchronous call
  - 3.4 Interaction styles: publish/subscribe
  - 3.5 Object/Service/Component lifecycle : servers and containers
  - 3.6 Data management
4. Architecture
5. Synthesis

## 3.1 Families of middleware

- RPC middleware
- Object Middleware
- Message Oriented Middleware
- Component Middleware
- Service Middleware
- Database middleware
- Persistency middleware

## 3.2 Main family history

## 3.3 Interaction styles: synchronous call

- **Middleware for distributed synchronous calls** (interaction layer)

- **RPC**: request broker,
- **CORBA**: object request broker, multi-languages, Local Area Network (LAN)
- **RMI**: object request broker, java, LAN
- **Web services (synchronous messages)**: multi-languages, Wide Area Network
  - **REST** (microservice architecture)
  - **SOAP** (Service Oriented Architecture, service orchestration)

## 3.4 Interaction styles: publish/subscribe

- Middleware for **publish/subscribe** (interaction layer)

- **MQTT** For the IoT
- **JMS** LAN
- **AMQP, RabbitMQ**

## 3.5 Object/Service/Component lifecycle : servers and containers

- **Application server** manager: instantiation, containers
  - Application Servers
    - JavaEE (JBoss, glassfish, Websphere):
    - Light servers : **Spring**
  - Web container : **Web Server (tomcat, jetty, LiteWebServer):**

## 3.6 Data management

- **Persistency middleware** handles persistency of data or objects (data layer)
  - **JavaEE** (EJB) includes persistency preoccupation (various technologies)
  - **Hibernate** is a persistency framework (from object to relational database paradigm)

# 4 Architecture

1. Which middleware?
2. Middleware for separation of concerns
3. Which middleware family
4. Architecture
  - 4.1 3 tiers Architecture
  - 4.2 Component based Architecture
  - 4.3 Service Oriented Architecture
  - 4.4 Microservice architecture
5. Synthesis

## 4.1 3 tiers Architecture

*Presentation*

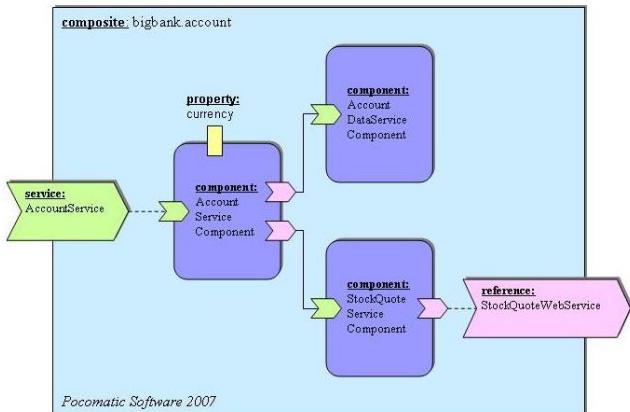

*Application logic*

*Persistency*

## 4.2 Component based Architecture

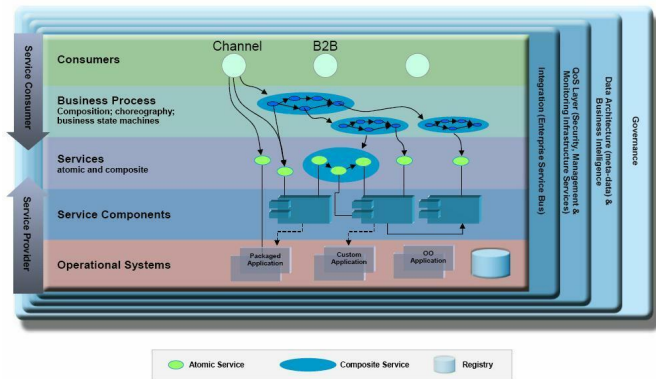

- Component abstraction
- Component Assembly (e.g. *SCA Service Component Architecture, Fractal components, CORBA Component Model*)

## 4.3 Service Oriented Architecture

### ■ Service Oriented Architecture (for sequence of services)

- Service abstraction
- Service Orchestration

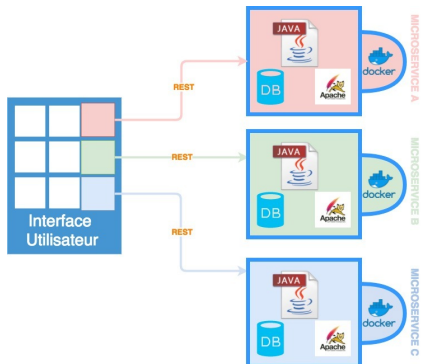

2. Source de la figure

<https://www.ibm.com/developerworks/mydeveloperworks/blogs/devaprasad/>

## 4.4 Microservice architecture

- A microservice is a software architectural style that structures an application as a collection of loosely coupled services.
- Advantages:
  - modularity
  - continuous delivery
  - better scalability
- Microservices interaction patterns
  - Services in a microservice architecture are often processes that communicate over a network
    - For synchronous interactions: REST over HTTP (one of the most popular)
    - For Asynchronous interactions: AMQP and Akka actors are good candidates

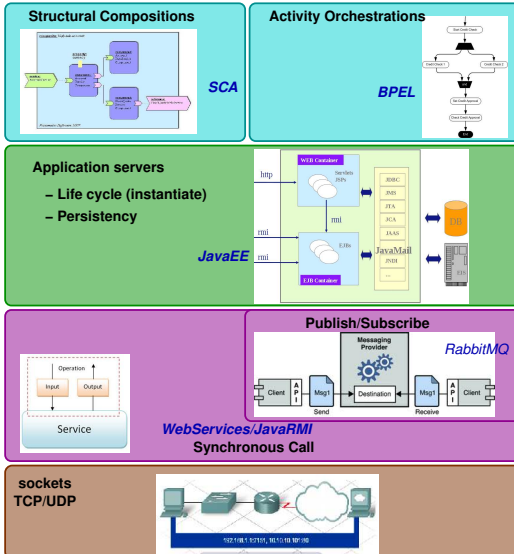

# 5 Synthesis

1. Which middleware?
2. Middleware for separation of concerns
3. Which middleware family
4. Architecture
5. Synthesis
  - 5.1 Layer view
  - 5.2 Conclusion

# 5.1 Layer view

## 5.2 Conclusion

- In the design of a distributed application, you first choose the middleware family, you choose the middleware itself later on (e.g. you first choose **Synchronous interaction** style and then *Java RMI* or *REST* WebService).
- Middleware connect pieces of software implemented separately (by different companies, developers . . . ) and available on the network.
- Standardisation is essential to connect pieces of software
- Universal adapter is of course not possible:
  - Many technologies are available with different characteristics (e.g., target platform, semantics, efficiency)
  - The basic of middleware is about distribution (RPC, RMI) sometimes called plumber solutions.
  - Above distribution, higher abstractions may be built: publish/subscribe, data distribution, persistency, presentation, naming, workflow, orchestration and composition.
